**uControl Extension Not Safe to Load**

The kernel extension was not loaded because it has been marked unsafe. This is a precaution to prevent repeated crashes. However, this may also happen if "Configure at Login" is not checked. Please check for an update if it was marked unsafe due to a crash. Note: there is a bug whereby desktop machines seem to be marked unsafe for no good reason.

Accessibility

Expert Options

☐ **Load at Startup**

Loads the kernel extension when the machine boots. If the machine should fail to boot when loading—possible when the OS is upgraded—it will not load on the next boot.

Extension is not loaded.

Load Extension

☐ **Configure at Login**

Configures the kernel extension when you login. (Specifically launches the uControlHelper when you login.)

☐ **Debug Logging**

Prints debug information to the log file:

`/var/log/system.log`
