Could not instantiate Driver.

KisMAC has not been able to load the driver (Atheros based card, passive mode). Reasons for this failure could be:

    1. You selecteted the wrong driver.

    2. You did not insert your PCMCIA card (only if you selected such a driver).

    3. Your kernel extensions screwed up. In this case simply reboot.

    4. You are using a 3rd party card and you are having another driver for the card installed, which could not be unloaded by KisMAC. If you have the sourceforge wireless driver, please install the patch, provided with KisMAC.
